

Modular container for disabled aircraft

This container can accommodate aircraft fuselages of up to 15m in length and ship worldwide, with minimal exposure to potential damage or external dangers.

This specially designed standard HC ISO 40' HC container has a fully removable front and roof, so the nose and/or tail can stick out with only limited exposure to the elements.

A cradle system is built in-house to meet the exact specifications of the fuselage and can be easily adapted and adjusted.

The movement of the fuselage out of or into the container is carried out on our purpose-built sledge and slide system, thereby minimizing any impact on the aircraft structure

This container is equipped with self-loading system, which makes us independent of any cranes or potentially fraught local loading practices meaning we remain in control of the load throughout the process, a concept simply not possible before.
